

Re-Reference Interval Prediction (RRIP) :

Motivation : Design a thrash-resistant and scan-resistant replacement policy that exploits Re-Reference Interval Prediction

- 1) SRRIP (Static Re-Reference Interval Prediction) \Rightarrow Scan resistant
 - 2) DRRIP (Dynamic Re-Reference Interval Prediction) \Rightarrow Scan & Thrash resistant
- * Requires only 2-bits per cache block \heartsuit .

Doubt: This paper says that DIP & LRU can't handle Scan. But it can !

RRIP:

\rightarrow Prevents cache blocks with distant re-reference interval from evicting blocks that have a near-immediate re-reference interval.

NRU: Not Recently Used \Rightarrow SRRIP with $m=1$

LFU: Least Frequently Used \Rightarrow Uses a counter to count the higher as near-immediate & lower as distant-future

+ mixed, cache friendly \hookrightarrow High locality

Doubt: Other than "Scanning" & "Thrashing" is there something else?

Doubt: Why can't DIP handle scan? → The B1P will star

(NRU) Not Recently Used:

→ Has a single nru-bit → says whether its near-immediate or distant future

- 0: Near immediate
- 1: Distant future.

→ On cache file, the first block from HEAD with nru-bit = 1 is evicted.

→ The newly added block becomes 0.

→ Once all nru-bit = 1 blocks are evicted, all the blocks with nru=0 are promoted to 1.

Issues with NRU:

Next Ref	RRIP head	RRIP tail
a_1	1 → 1 → 1 → 1 → miss	1 1 1 1 miss
a_2	$a_1 \rightarrow 1 \rightarrow 1 \rightarrow 1 \rightarrow$ miss	$a_1 0 \quad 1 \quad 1 \quad 1 \quad$ miss
a_2	$a_2 \rightarrow a_1 \rightarrow 1 \rightarrow 1 \rightarrow$ hit	$a_2 0 \quad a_2 0 \quad 1 \quad 1 \quad$ hit
a_1	$a_2 \rightarrow a_1 \rightarrow 1 \rightarrow 1 \rightarrow$ hit	$a_1 0 \quad a_2 0 \quad 1 \quad 1 \quad$ hit
b_1	$a_1 \rightarrow a_2 \rightarrow 1 \rightarrow 1 \rightarrow$ miss	$a_1 0 \quad a_2 0 \quad 1 \quad 1 \quad$ miss
b_2	$b_1 \rightarrow a_1 \rightarrow a_2 \rightarrow 1 \rightarrow$ miss	$a_1 0 \quad a_2 0 \quad b_1 0 \quad 1 \quad$ miss
b_3	$b_2 \rightarrow b_1 \rightarrow a_1 \rightarrow a_2 \rightarrow$ miss	$a_1 0 \quad a_2 0 \quad b_2 0 \quad b_1 \quad$ miss
b_2	$b_3 \rightarrow b_2 \rightarrow b_1 \rightarrow a_2 \rightarrow$ miss	$b_3 0 \quad a_2 1 \quad b_1 1 \quad b_2 \quad$ miss
a_1	$b_2 \rightarrow b_3 \rightarrow b_2 \rightarrow b_1 \rightarrow$ miss	$b_3 0 \quad b_4 0 \quad b_1 1 \quad b_2 \quad$ miss
a_2	$a_1 \rightarrow b_4 \rightarrow b_3 \rightarrow b_2 \rightarrow$ miss	$b_3 0 \quad b_4 0 \quad a_1 0 \quad b_2 \quad$ miss
	$a_2 \rightarrow a_1 \rightarrow b_2 \rightarrow b_3$	$b_3 0 \quad b_4 0 \quad a_1 0 \quad a_2 \quad$ miss "nru-bit"

(a) LRU

(b) Not Recently Used (NRU)

→ For Scan: Keeps block that will never be used

→ For Thrash: Evicts block that may be used later.

↳ Solution → SRRIP & DRRIP
RRPV = Re-ref Fixed Value .

→ In NRU 2 possible values are there since we use 1 bit. $M = 1 \Rightarrow 2^M = 2^1 = 2$.

↳ 0 → Immediate
1 → Distant .

→ This work introduces the use of 2^M , $M > 1$ values . So we can also track intermediate cases .

SRRIP/DRRIP = NRU, when $M = 1$.

RRP

RRP

$\sim M-2$

RRP

→ SRRIP/DRRIP : Same as NRU. Select the victim with non-bit > 0 . Select victim from HEAD side. But in NRU, you update everything to 1 when there is no 1. Here it differs here.

RRIP hit promotion policy:

→ Hit Priority (HP)

→ Frequency Priority (FP)

SRRIP (static RRIP): (The heuristic is based on hit, miss statistics).

RRIP-HP:

-HP: mix make
→ Block with us converted immediately to near immediate. RRPV=0

RRIP-FP:

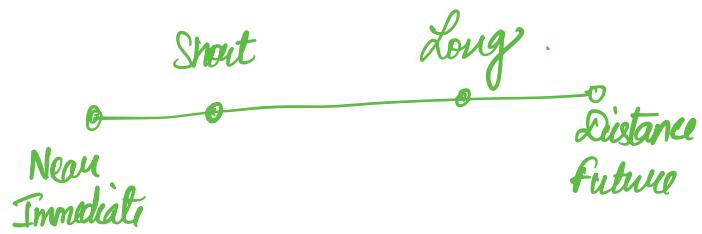

→ Replace blocks with no hits over blocks with at least 1 hit.
↳ problematic when the block gets hit only once & never again → Occupies space

→ To fix this, at each fit, instead of making $RRPV = 0$ (like RRIP-HP).

the counter is decremented once

RRIP-HP:

Insertion : Long

Eviction : Distance future

Promotion : Near-intermediate

RRIP-FP:

Insertion : Long

Eviction : Distance future

Promotion : Short

* SRRIP can't store active blocks when scan length $> (2^M - 1) * (A - w)$

A = associativity
w = working set.

* SRRIP can't handle thrashing

Solution : BRRIP \Rightarrow Bimodal RRIP

Similar to BIP

↳ Majority @ distant
↳ Some @ long

But not good for scanning.

Final Solution : DRRIP \Rightarrow SRRIP(Scan resist) +
BRRIP(Thrash resist) +
Set dealing

Doubt : Why 4.4 exists ?

Mind Map:
